Creating a More Effective Search

There are many ways to limit your search results within a database or on the web. You can combine search terms with **and** (which narrows the search) **or** (which expands the search) **not** (to eliminate search criteria), select "Full Text" to view all of the information in the article, and to retrieve a scholarly peer-reviewed article select "Peer Reviewed." You can also search by a date range. Keep in mind that not all databases or search engines use exactly the same subjects or search terms. Keep track of all suggested search terms, "See Also," or spelling differences. You can also search phrases in "quotes," for example "space station."
